POCKET SPRING TECHNOLOGY

Pocket springs, thanks to the production technology, each coil is positioned in a pocket. In this way, the spirals working independently of each other only respond to the pressure applied to that area. They also operate very quietly. Pocket springs do not act as a whole, unlike traditional open coil springs, they act independently and provide much more comfort.

Thus, since it provides independent support to each part of the body, it prevents the couples from disturbing each other by absorbing their movements during sleep.

Pocket springs provide support that conforms to the shape of the body.

It provides more durable and long-lasting comfort by compressing the spirals and taking the pocket position.

Springs can be packed in rollpack form in our factory..

OUR ABILITY		MIN	MAX
	Waist Diameter	k (mm)	47 70
	Wire Diameter	t (mm)	1,6 2,2
	Pocket Height	H(mm)	70 220

POCKET SPRING WITH ZONE

Your body is supported by a package spring system that is divided into zones and can work independently of each other. What is the difference?

In addition to having all the package spring technology, it has many additional advantages. The pocket spring system divided into five zones offers variable support for different parts of your body! It balances the different pressures exerted on the bed by the head, shoulders, back, hips, thighs and feet. It helps maintain spine alignment and provides extra support.

BONNELL SPRING

It is our spring system, which is formed by heat treatment and obtained by combining the hourglass-shaped spirals. In this geometry, the wide part of the hourglass flexes easily and facilitates flexibility under pressure, providing initial comfort. They are durable and supportive springs.

OUR ABILITY		MIN	MAX
	Head Diameter	k (mm)	82 92
	Wire Diameter	t (mm)	2,2 2,4
	Turn Number	N	4 7
	Spring Height	H(mm)	80 200
